microTCP.™ The GENESYS™ Material utilizes a patented micro filtration process yielding β -TCP particles to their smallest form, known as microTCP.

Strength. These proprietary microTCP particles are uniformly embedded throughout the 96L/4D PLA bioabsorbable polymer, delivering a more porous and stronger biocomposite material.¹

Ingrowth. GENESYS™ Matryx® provides reliable fixation during the critical healing period. It is followed by resorption exposing a scaffold which enables bone ingrowth to aid in the restoration of the patients’ natural anatomy both biologically and mechanically.¹

Graft Fixation Strength

**Data on file.*

As the chart demonstrates, ***Graft Fixation Strength*** performance of the GENESYS™ Matryx® Interference Screw far surpasses the Mitek Milagro.

¹Dalcusi, Guy, et al. Long Term Study of Bone In-Growth Process at the Expense of Poly(96L/4D-lactide)/beta-tricalcium Phosphate Composite. INSERM U791: Osteoarticular and Dental Tissue Engineering Research Center. 2011.

Low Profile Rounded Head

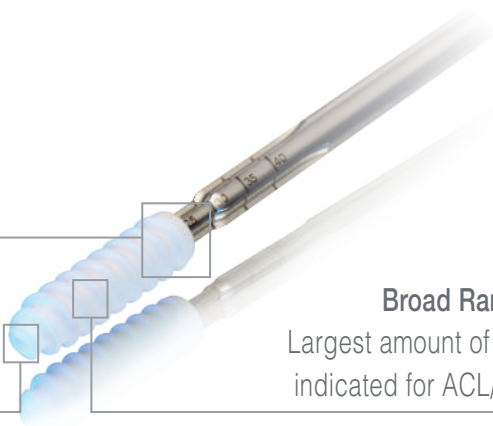

Reduces trauma to graft and improves femoral aperture fixation

Thread Tip Design

Threads extend to the distal tip, easing screw insertion

Broad Range of Sizes

Largest amount of size options indicated for ACL/PCL fixation
